LifeCharter Command Suite: Replacement-Cost Assumptions

Prepared October 2026 for the Investor Brief data room. An estimate of what it would cost to commission the product from outside developers. It is not an appraisal and not a statement of value.

The scope being priced

A multi-account platform with a CRM, email campaigns and sequences, booking, scoring and assessments, finance, an AI assistant that acts behind approval, projects and tasks, affiliates, a community and replay app, a certification portal, and integrations with Stripe, Zoom, Resend and the social platforms. This is a platform, not a website.

Hours and cost by who builds it

Who builds it	Rate per hour	Hours	Estimated total
Overseas or junior freelancer	$50 to $75	1,000 to 1,300	$50,000 to $100,000
US freelancer or small studio (used in the brief)	$100 to $150	1,000 to 1,300	$100,000 to $195,000
US agency	$175 to $250	1,000 to 1,300	$175,000 to $325,000

The 1,000 to 1,300 hours include testing and project management. They are an estimate of what an outside developer would need for the same scope, and they can be changed: the total is hours multiplied by rate.

How the product was actually built

By the founder working with AI-assisted development, in an estimated 300 to 350 hours of working time. The actual cost was therefore far below the estimate above. That is a capital-efficiency advantage, and it is also why the estimate should be read as replacement cost, not as what was spent.

What is not in the figures

Would likely be added: design of the brand system and interface (about $10,000 to $25,000), copy and help content, and ongoing maintenance (about 10 to 20 percent of the build a year).
Not included: the founder's strategy and direction, the running costs of hosting, payments and AI, and the other projects (the founder's website, LC Fledge and the Command Shift app), which would be quoted separately.
Time to market: a typical client commissioning this would have waited roughly 6 to 12 months for it.

How to use this number

It shows the size of the asset behind the ask. It is not used to argue valuation, and the brief proposes none. Rates are typical market ranges and the hours are an estimate, so the figure is approximate by design.
